Environmental noise

...and many other things degrade audio.

- ✦ irregular tape playback
- ✦ dynamic range compression in radio and tv broadcasts
- ✦ audio speedup on the radio
- ✦ noise
- ✦ clipping and other distortion
- ✦ ... and yet more.

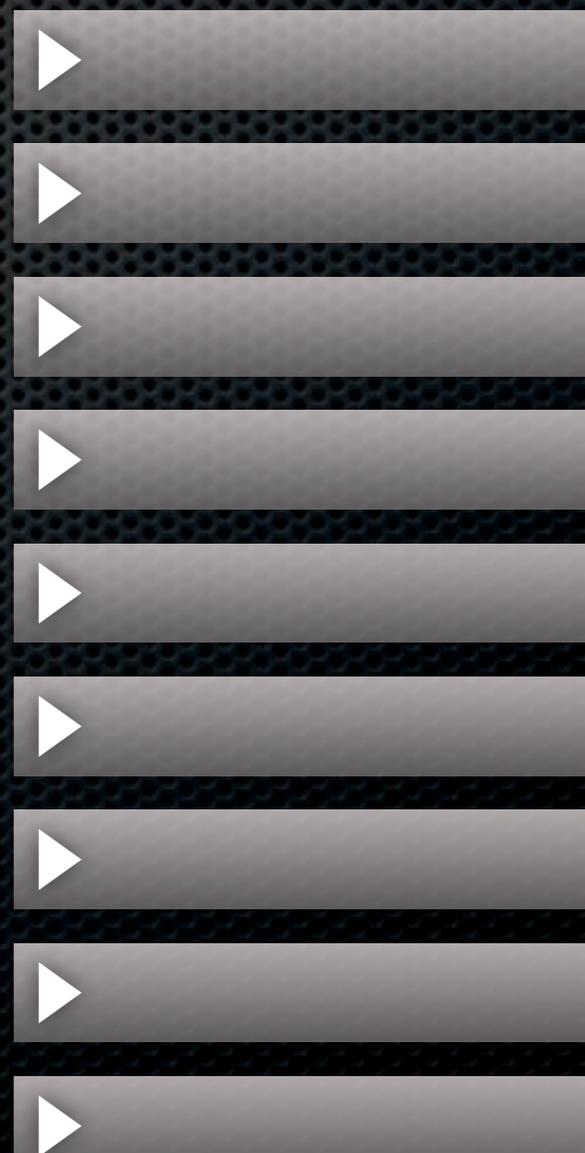

Audio Collection Quality

- ✦ most audio collections
 - ✦ contain some audio of low quality
 - ✦ contain recordings of different qualities
 - ✦ contain recording of *unknown* quality

Audio Collection Quality

- ✦ most audio collections
 - ✦ contain some audio of low quality
 - ✦ contain recordings of different qualities
 - ✦ contain recording of *unknown* quality

Impact on Music Informatics

- ✦ methods are usually tested only on one (or few) audio collections, hence:
 - ✦ feature extractors (etc.) might fail in the real world
affects MIR researchers' work
 - ✦ if feature extractors work, it is not clear if they correlate with content or audio quality
affects 'digital musicologists' and industry

Audio Degradation Toolbox

- ✦ most comprehensive collection of Matlab code for audio degradation
- ✦ designed to make it easy to degrade audio in many different ways
- ✦ aim: encourage MIR researchers to test their algorithms under many different conditions

The screenshot shows the project page for the Audio Degradation Toolbox on SourceForge. The page includes a navigation menu with links for Overview, Members, Activity, Publications, Downloads, Repository, Code docs, and Settings. The main content area is divided into several sections: Overview, Members, Recent activity, Getting Started, and License. The Overview section describes the toolbox's purpose and lists various degradation units. The Members section identifies the project manager as Matthias Mauch and Sebastian Ewert. The Recent activity section shows a list of recent commits and releases, including version 0.1. The Getting Started section provides instructions on how to download and use the toolbox. The License section states that the toolbox is released under the GNU General Public License 2.0 or later.

Degradation Unit Example

```
parameter.noiseColor = 'brown';  
[audio_out, timestamps_out] =  
    degradationUnit_addNoise(audio, samplingFreq,  
                             timestamps, parameter)
```

- ✦ example sound before / after
- ✦ why “timestamps” — we’ll see later.

Degradations

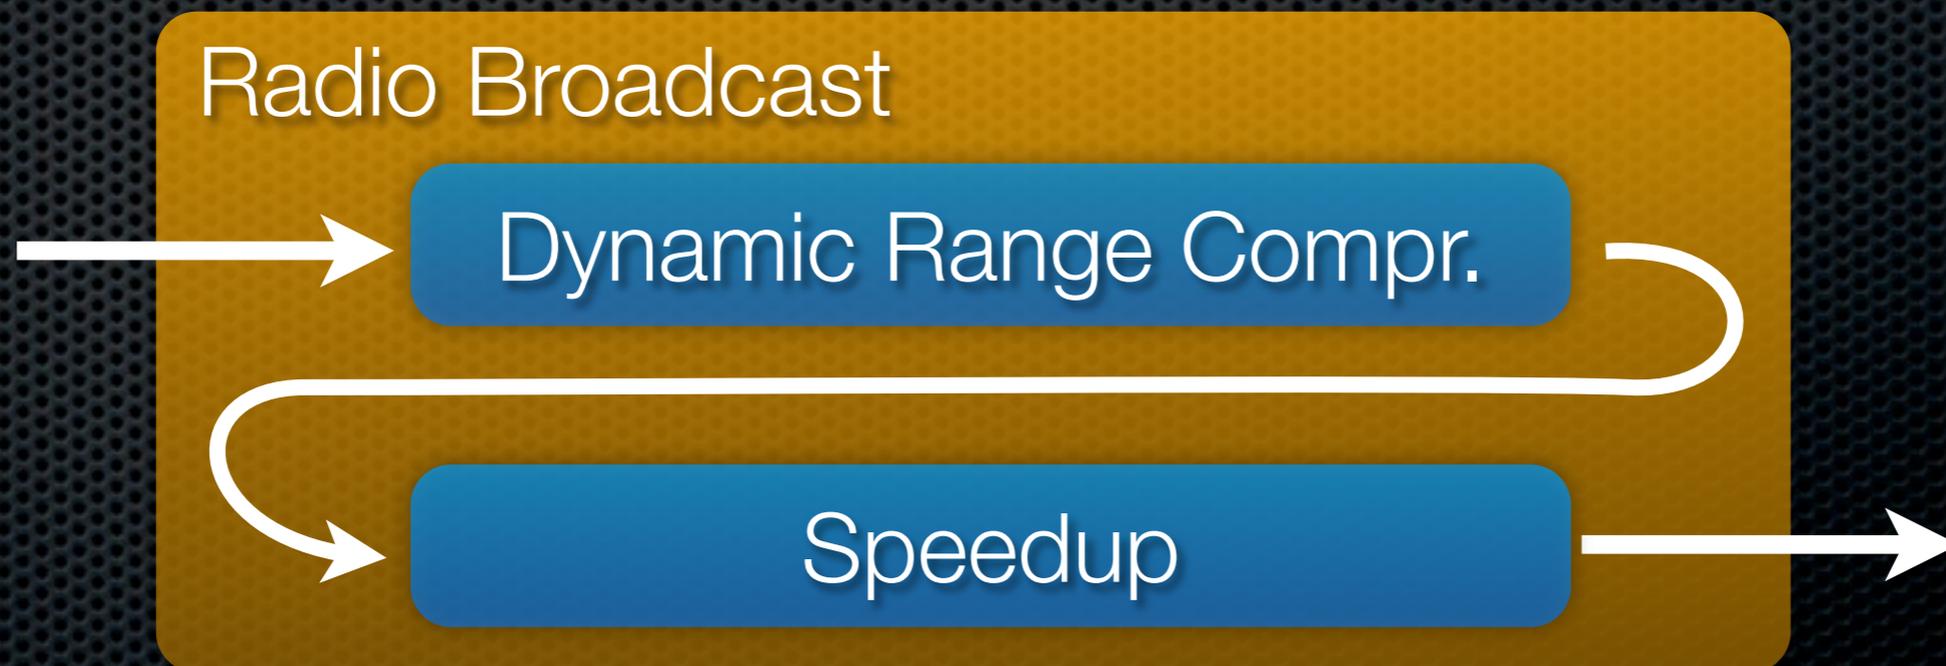

- ✦ to make complex “Degradations” we can make chains from degradation units
 - ✦ ... like audio effects!
- ✦ Example: *Radio Broadcast Degradation*

Dynamic Range Compr.

Speedup

Degradations

- ✦ to make complex “Degradations” we can make chains from degradation units
 - ✦ ... like audio effects!
- ✦ Example: *Radio Broadcast* Degradation

Degradations — examples

- ✦ Lots of audio examples (file:///localhost/Users/matthiasm/code/audio-degradation-toolbox/html/audio_examples.html)
- ✦ Examples with spectrogram:
 - ✦ Wow resampling on cello (file6)
 - ✦ Live Recording on file1

Comparing to Ground Truth

- ✦ one main purpose:
evaluate methods under different degradations
- ✦ **problem** — we have time-distorting degradations
- ✦ **solution:** every degradation can also transform ground truth to the time line of the degraded audio
 - ✦ example: beat tracking ground truth after “Speedup” degradation

Comparing to Ground Truth

- ✦ one main purpose:
evaluate methods under different degradations
- ✦ **problem** — we have time-distorting degradations
- ✦ **solution:** every degradation can also transform ground truth to the time line of the degraded audio
 - ✦ example: beat tracking ground truth after “Speedup” degradation

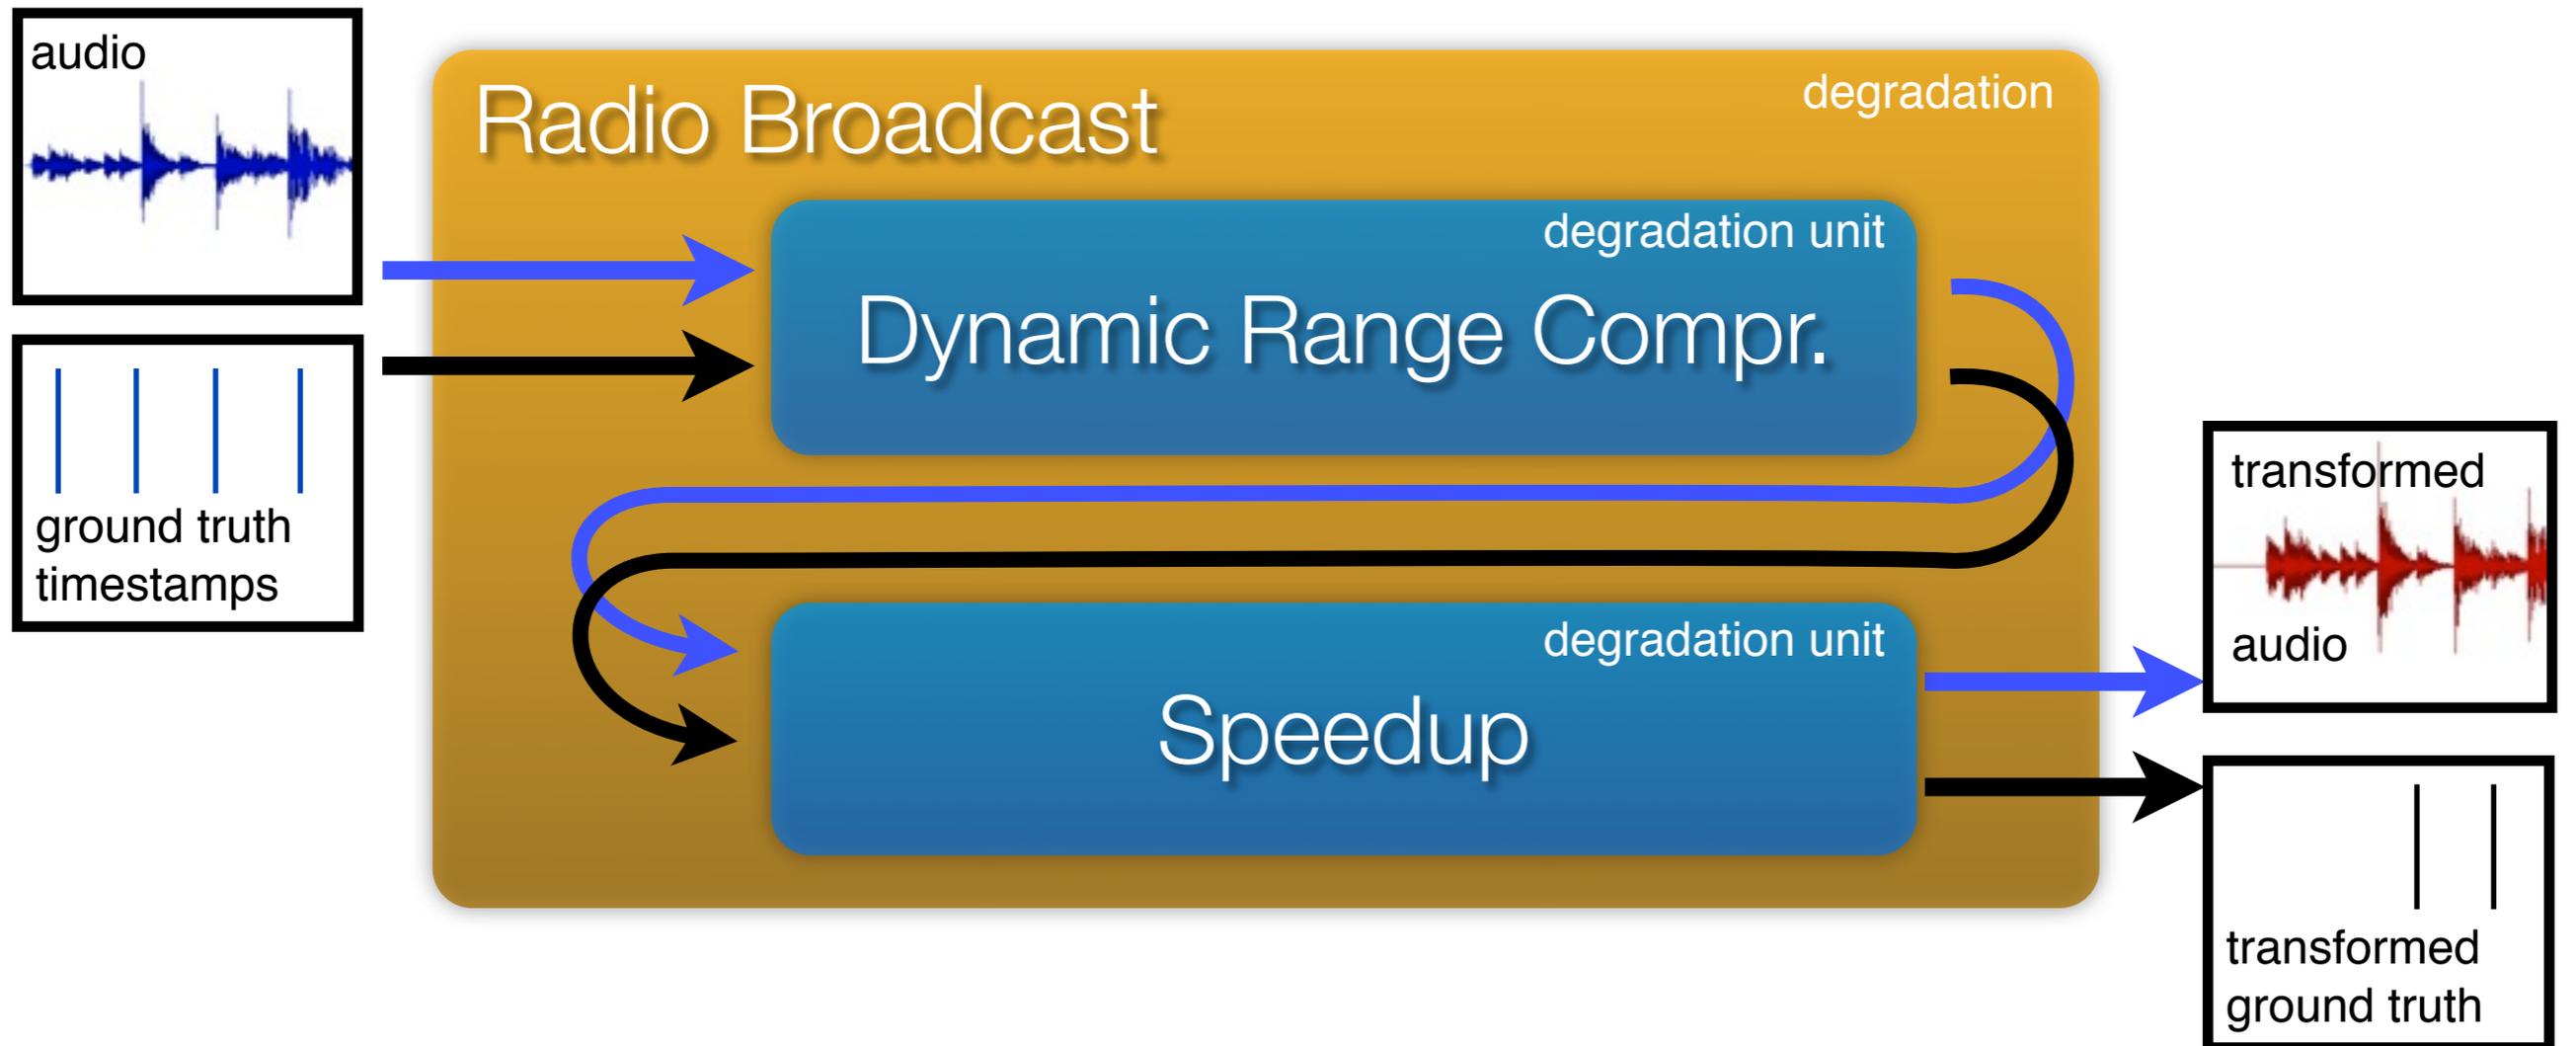

Comparing to Ground Truth

- ✦ one main purpose:
evaluate methods under different degradations
- ✦ **problem** — we have time-distorting degradations
- ✦ **solution:** every degradation can also transform ground truth to the time line of the degraded audio
 - ✦ example: beat tracking ground truth after “Speedup” degradation

Revisit Example

Experiments on 'Real-World' Degradations

Live Recording

Radio Broadcast

Smartphone Playback

Smartphone Recording

Strong MP3 Compression

Vinyl Recording

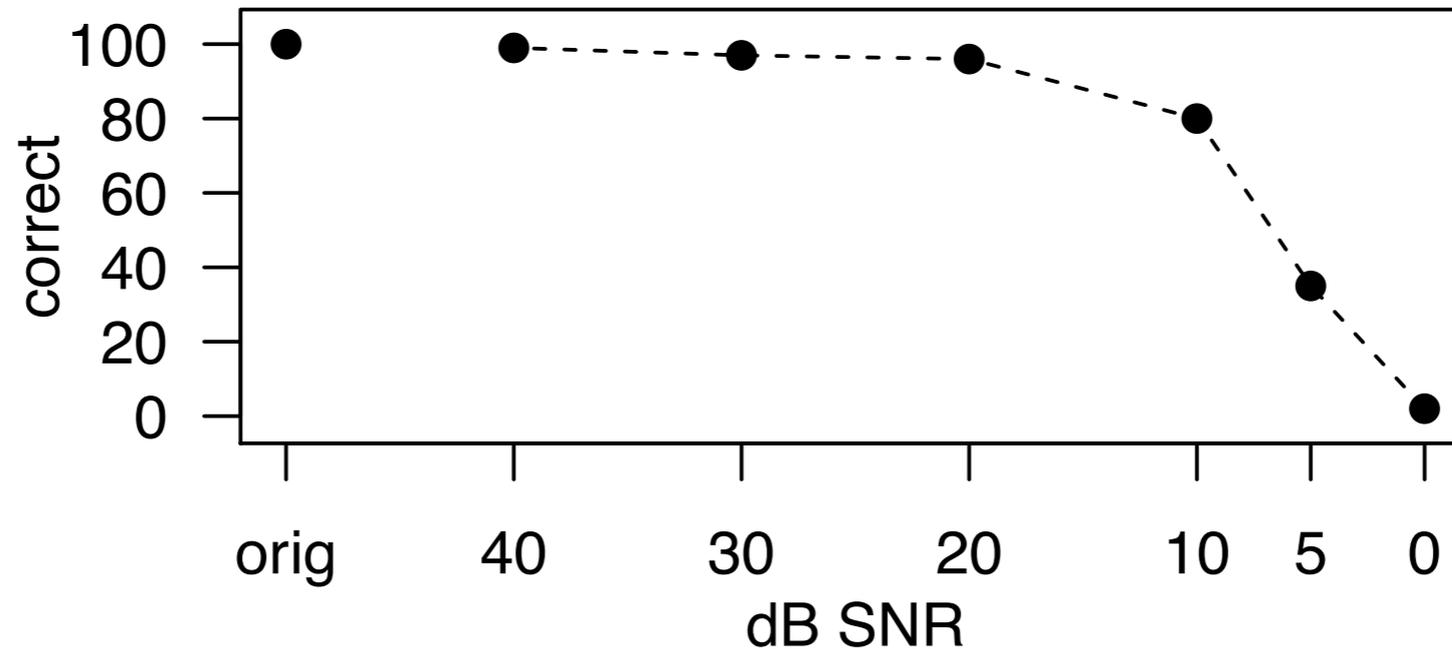

Results I — Audio ID

- ✦ audio ID fails for most “Real-World” degradations, not for mp3
- ✦ robustness to pink noise is ok

	correct	incorrect	not identified
Original	100	0	0
Live	0	0	100
Radio	3	3	94
PhonePlay	0	1	99
PhoneRec	5	7	88
MP3	100	0	0
Vinyl	4	0	96

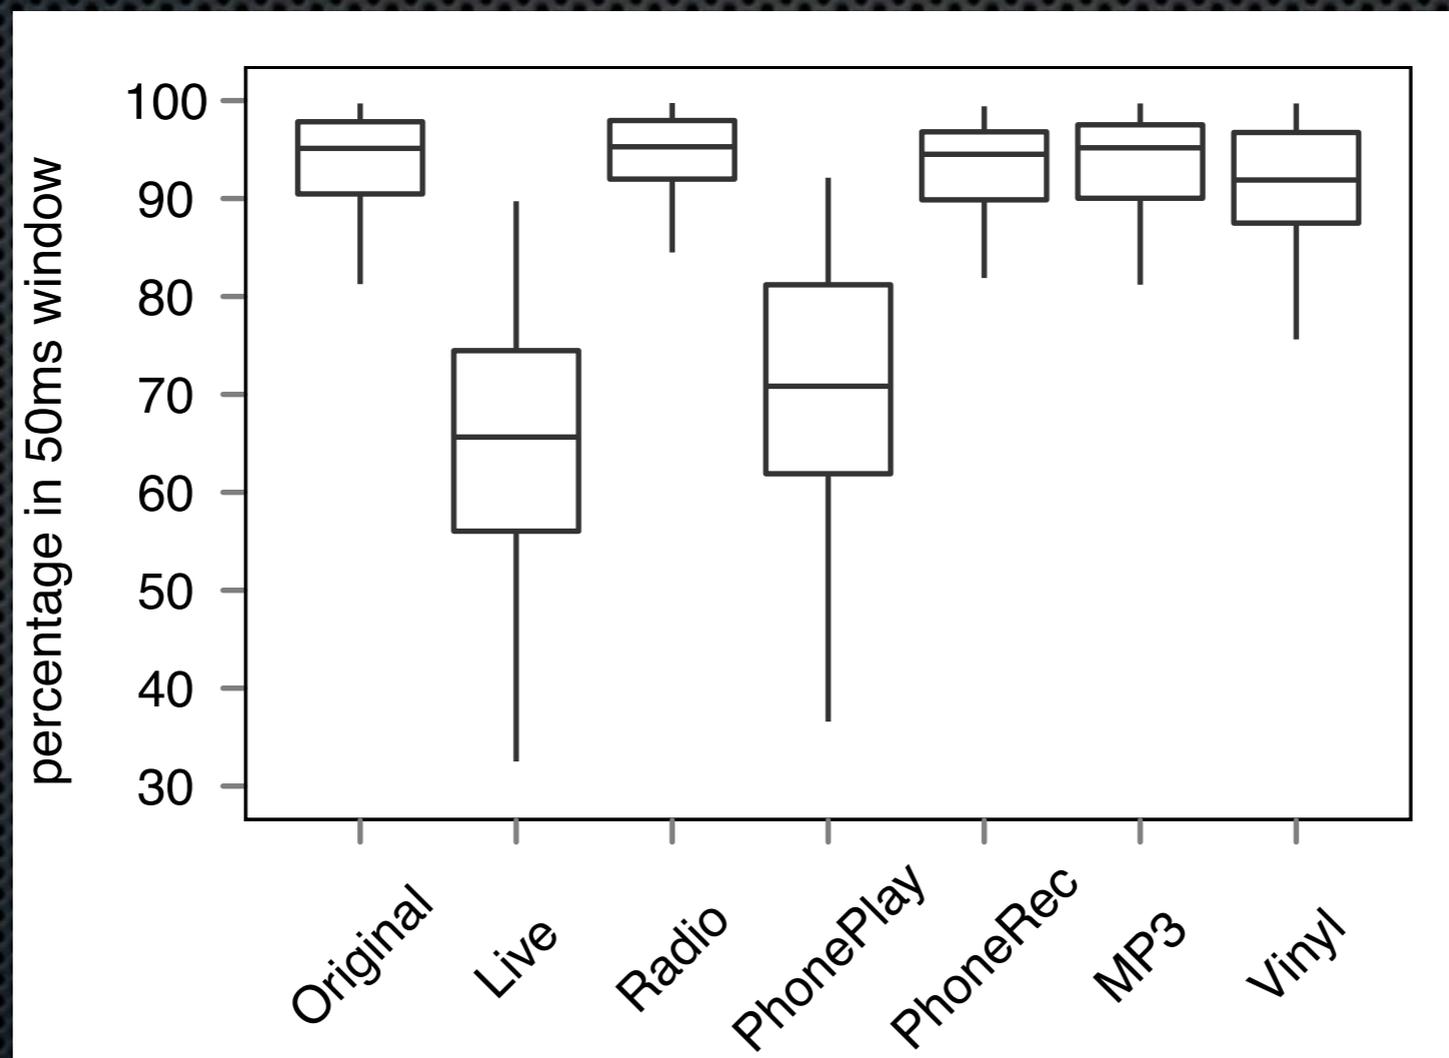

Results I — Audio ID

- ✦ audio ID fails for most “Real-World” degradations, not for mp3
- ✦ robustness to pink noise is ok

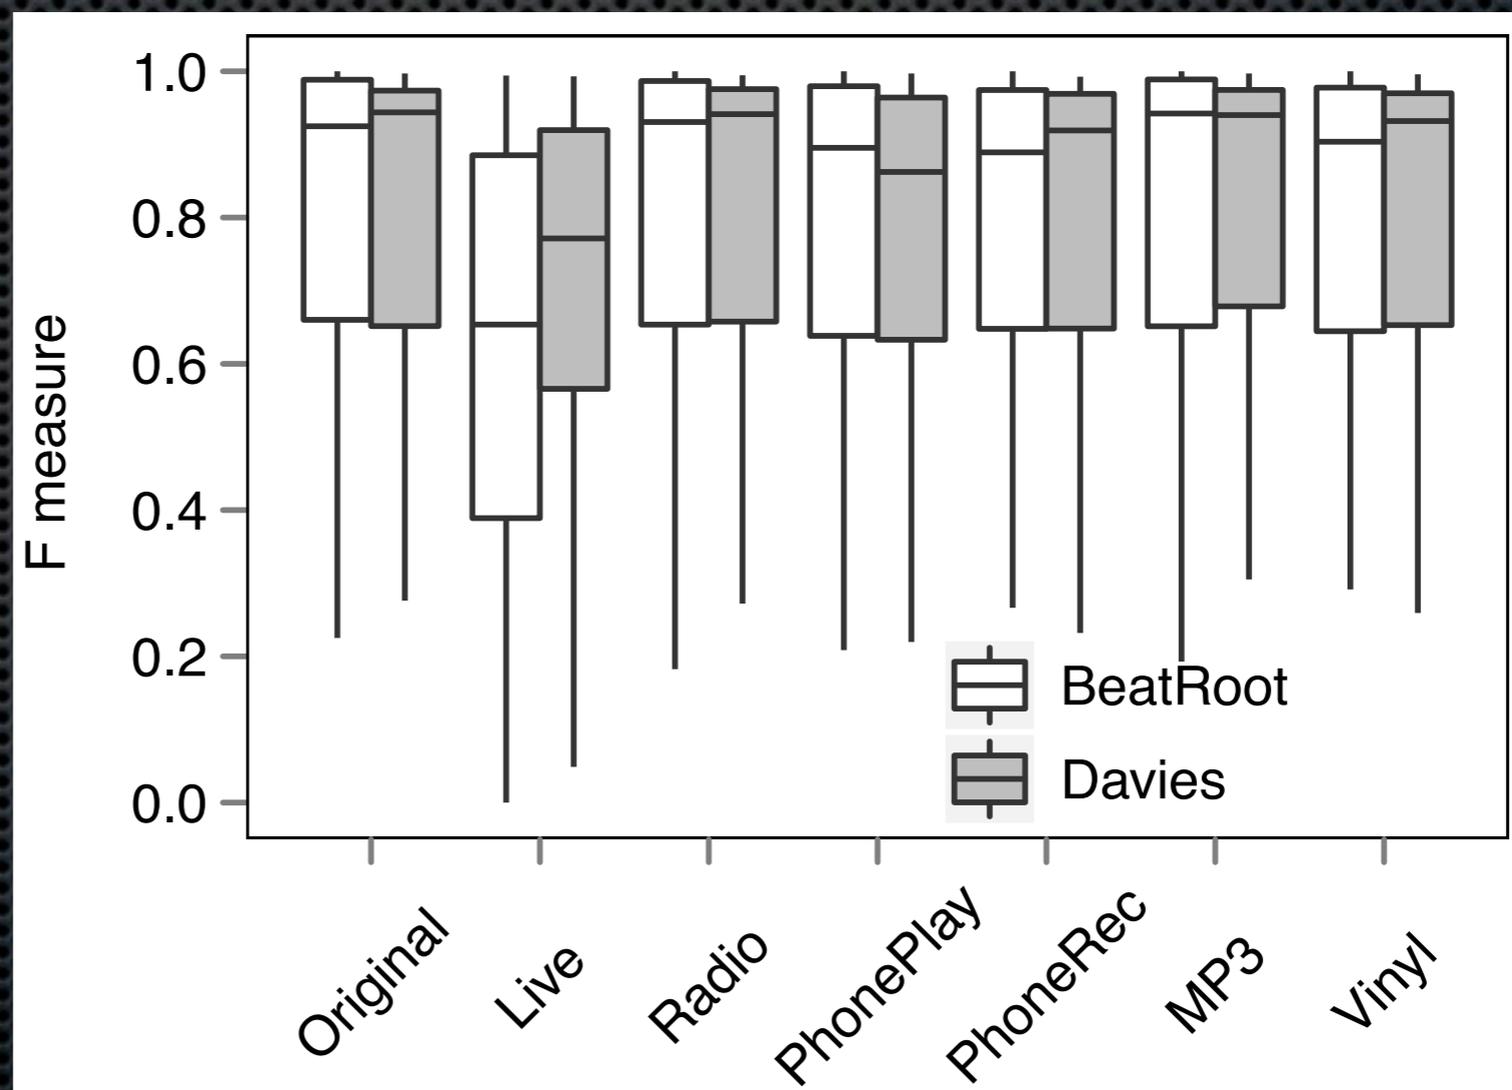

Results II — Score-to-audio alignment

- pretty much falls over for “Live” and “Phone Playback” degradations
- explanations: onset duplication; bass harmony missing

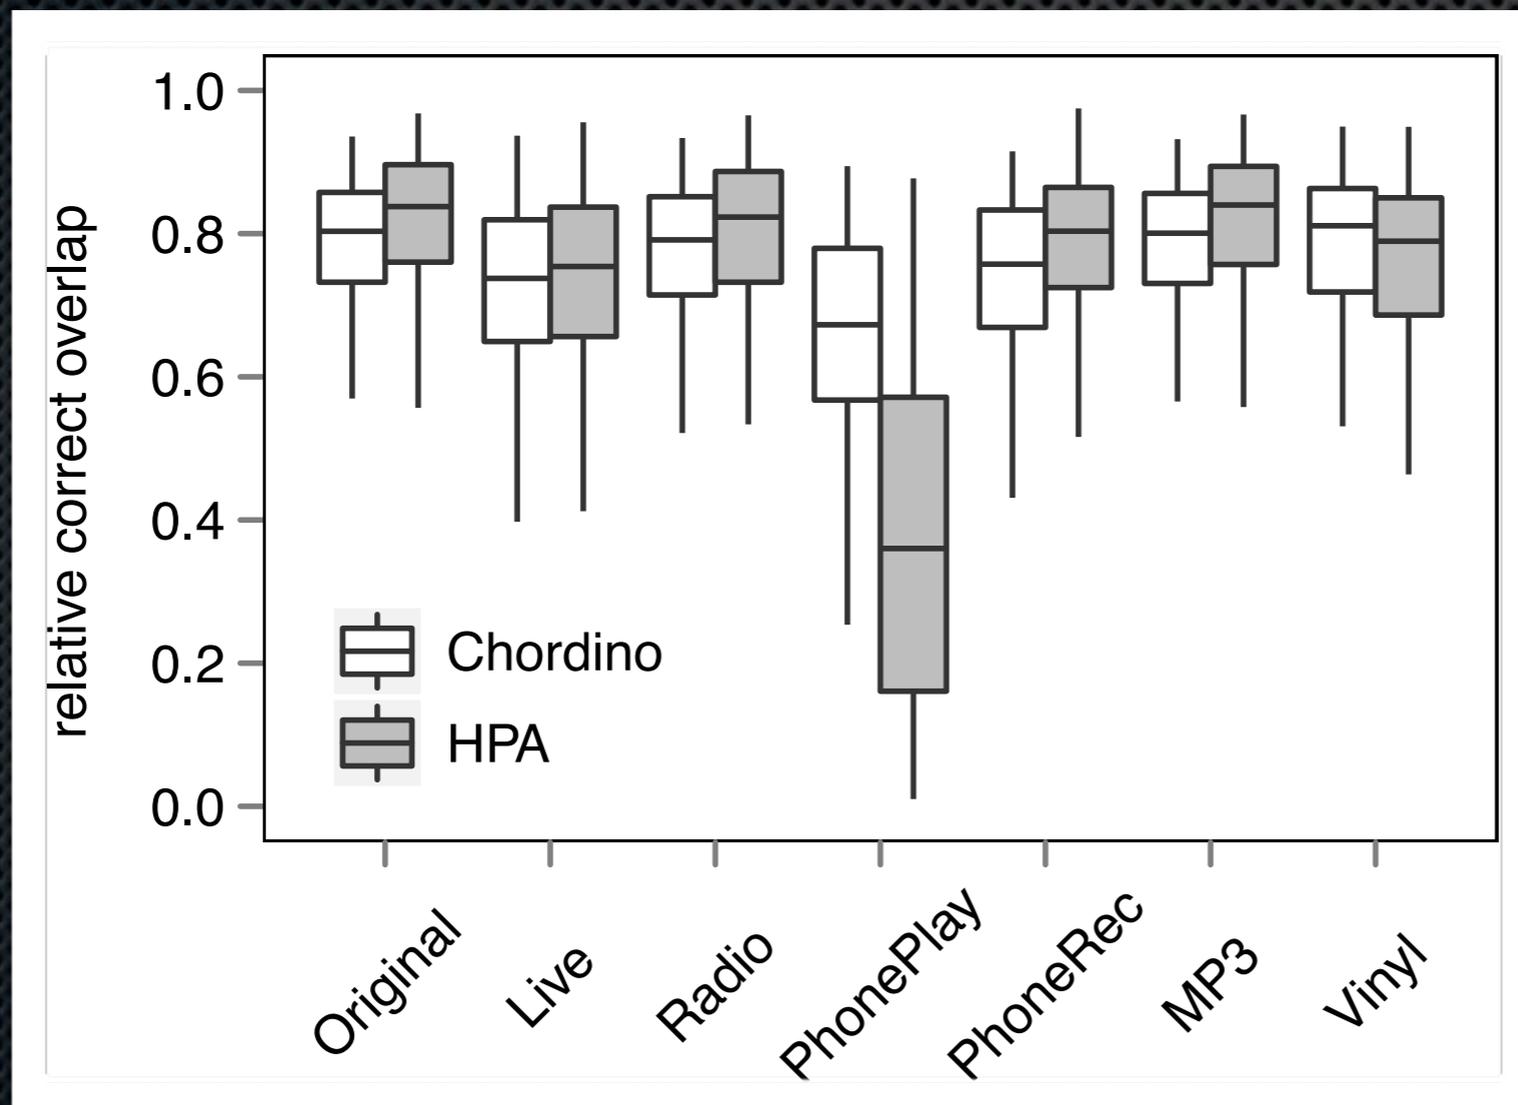

Results II — Beat-tracking

- ✦ compare two methods: BeatRoot, Davies
- ✦ very similar, but Davies more robust to “Live” degradation

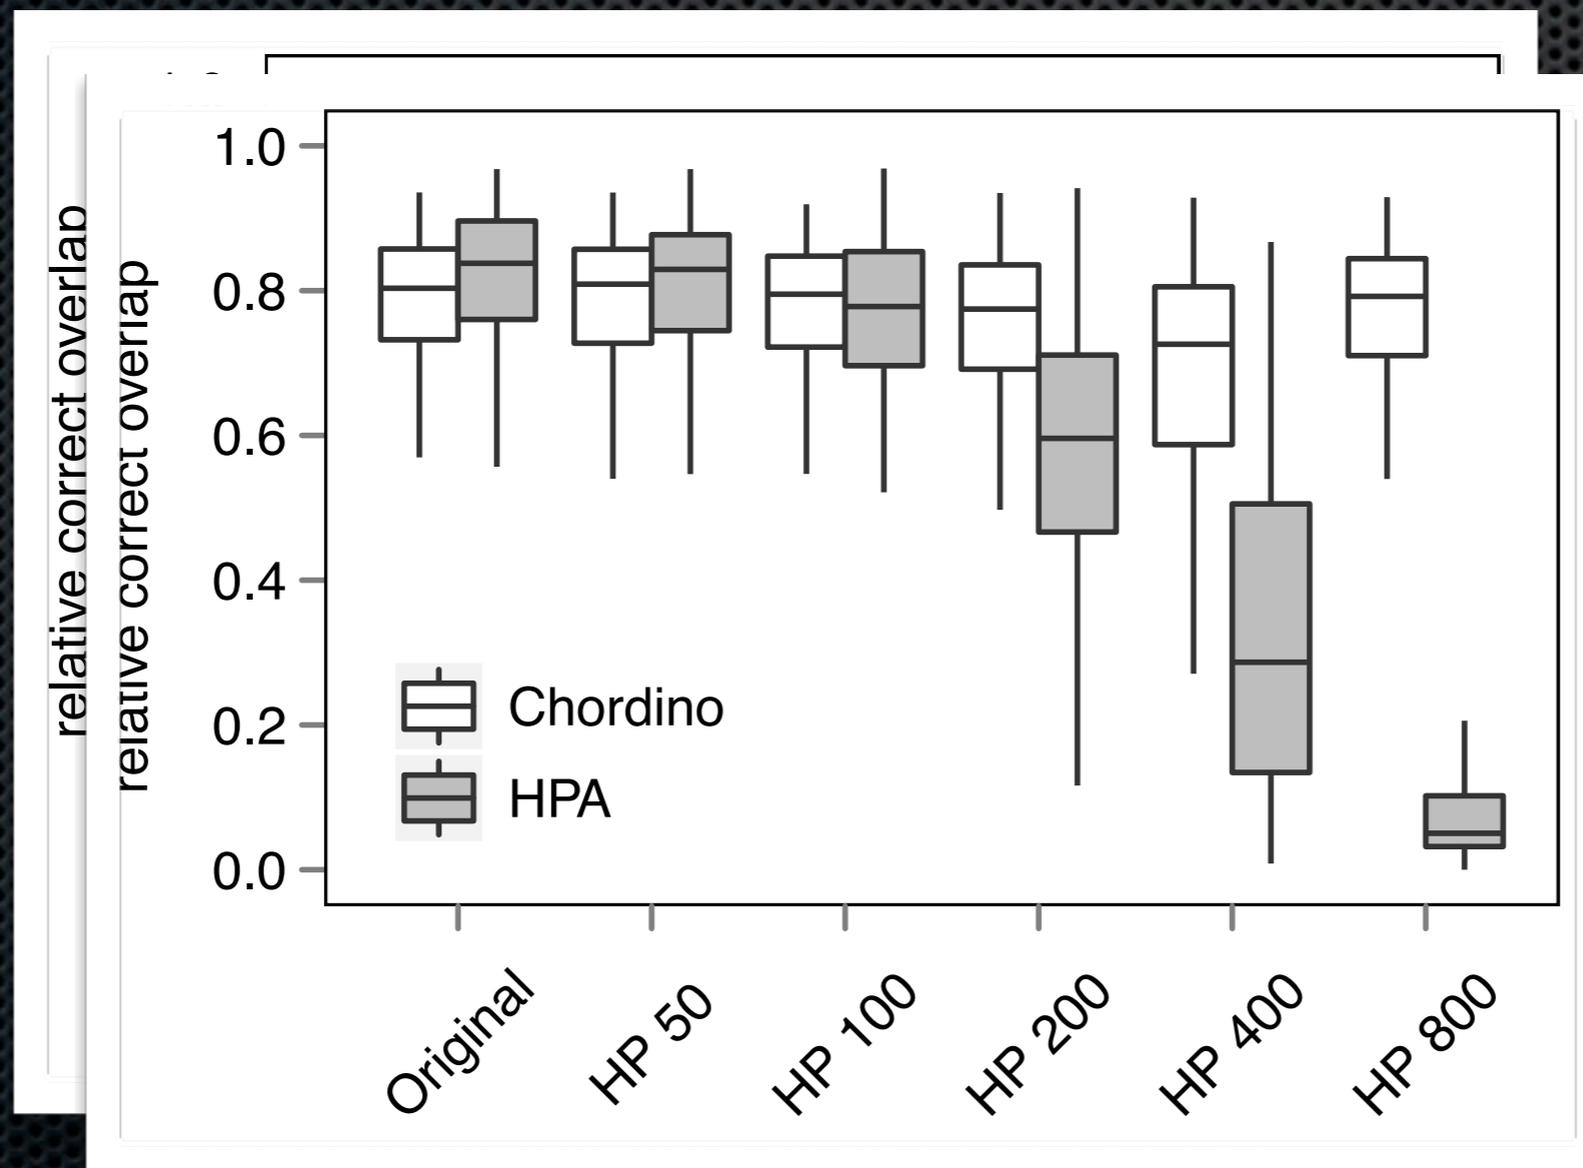

Results IV — Chord recognition

- compare two methods: Chordino, HPA
- HPA usually better, Chordino more robust on “Phone Play”

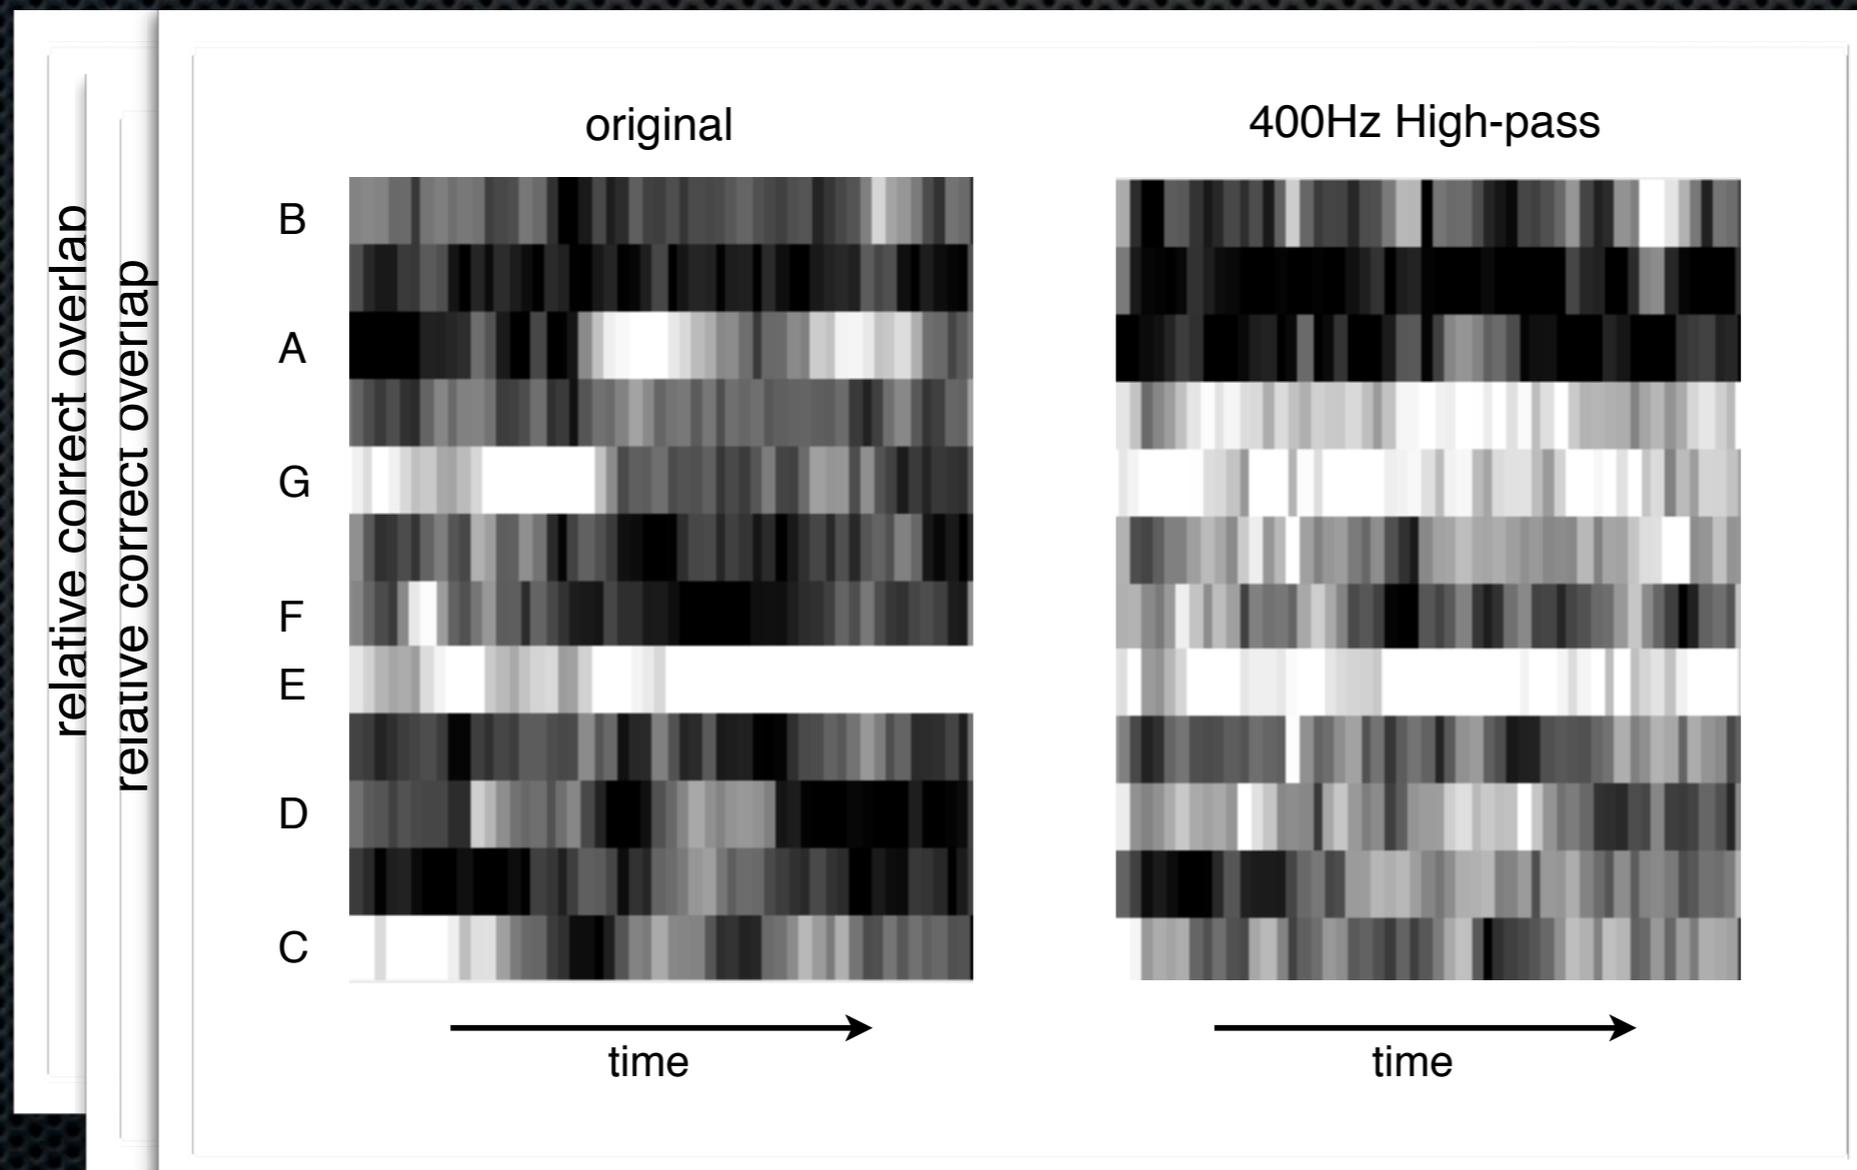

Results IV — Chord recognition

- compare two methods: Chordino, HPA
- HPA usually better, Chordino more robust on “Phone Play”

Results IV — Chord recognition

- compare two methods: Chordino, HPA
- HPA usually better, Chordino more robust on “Phone Play”

Summary

- ✦ Audio Degradation Toolbox offers
 - ✦ easy-to-use degradations
 - ✦ more comprehensive than other existing toolboxes
 - ✦ ground truth time-line transform to evaluate on time-warping degradations
- ✦ Results show: ADT is useful to detect strengths and weaknesses of MIR methods
- ✦ For paper, audio examples, source code:
<http://code.soundsoftware.ac.uk/projects/audio-degradation-toolbox>

What's up next?

- ✦ convince everyone to use the ADT :)
- ✦ work with it ourselves...
 - ✦ degraded audio as additional training data
 - ✦ affect of degradation on human ground truth labelling
