WHY ARE WE DOING THIS RESEARCH? Our goal is to establish basic scientific knowledge about the ability of the human ear and brain to organize mixtures of sounds. This is a study of the functioning of the normal human auditory system. It has nothing to do with your personality or motivations or intelligence.

PRIVACY. In this type of research, we are interested in the effects of different types of sound, averaged across individuals. We know that you value your privacy. You will not be identified as an individual in any scientific report of this research, and your name will not be linked to your responses in this study.

DISCUSSION OF THE RESEARCH IDEAS. We cannot discuss our ideas with you before the experiment takes place, but we will be happy to talk with you about our hypotheses and theories afterwards.

WHAT WILL HAPPEN DURING THE EXPERIMENT? You will be seated in a quiet room and hear a sequence of sounds. The sounds will not be loud enough to cause you discomfort or to adversely affect your hearing. There is no known risk associated with the experiment. You will be free to discontinue your participation at any time without penalty. If you are currently taking prescription drugs, over-the-counter drugs (such as antihistamines, cold or flu remedies, sleeping aids), or recreational drugs (such as marijuana, ecstasy, etc.) these could affect your judgments or your reaction time. If you are taking any of these, please don't participate in the experiment without informing the experimenter that you are taking something. If you do not feel comfortable discussing the specifics of your drug use with the experimenter, you are of course free to opt out of the experiment with no reason, and still receive your \$15.

The experiment will take about 45 minutes of your time and you will receive \$15 in compensation.

PARTICIPANT'S STATEMENT:

"I have read the preceding details and agree to participate."

McGILL UNIVERSITY

WHY ARE WE DOING THIS RESEARCH? Our goal is to establish basic scientific knowledge about the ability of the human ear and brain to organize mixtures of sounds. This is a study of the functioning of the normal human auditory system. It has nothing to do with your personality or motivations or intelligence.

PRIVACY. In this type of research, we are interested in the effects of different types of sound, averaged across individuals. We know that you value your privacy. You will not be identified as an individual in any scientific report of this research, and your name will not be linked to your responses in this study.

DISCUSSION OF THE RESEARCH IDEAS. We cannot discuss our ideas with you before the experiment takes place, but we will be happy to talk with you about our hypotheses and theories afterwards.

WHAT WILL HAPPEN DURING THE EXPERIMENT? You will be seated in a quiet room and hear a sequence of sounds. The sounds will not be loud enough to cause you discomfort or to adversely affect your hearing. There is no known risk associated with the experiment. You will be free to discontinue your participation at any time without penalty. If you are currently taking prescription drugs, over-the-counter drugs (such as antihistamines, cold or flu remedies, sleeping aids), or recreational drugs (such as marijuana, ecstasy, etc.) these could affect your judgments or your reaction time. If you are taking any of these, please don't participate in the experiment without informing the experimenter that you are taking something. If you do not feel comfortable discussing the specifics of your drug use with the experimenter, you are of course free to opt out of the experiment with no reason, and still receive your \$15.

The experiment will take about 45 minutes of your time and you will receive \$15 in compensation.

PARTICIPANT'S STATEMENT:

"I have read the preceding details and agree to participate."
