apt-get install unzip

This will set vi to run in nocompatible mode (so you can actually use arrow keys while in edit mode)

```
echo "set nocompatible" > ~/.exrc
```

#2 - 2015-09-22 04:32 PM - Giulio Moro

Make sure the script that makes node start exits (run node in a screen).

Found out how to avoid the root password at all:

```
edit /etc/pam.d/common-auth
```

edit the existing line to :

```
auth [success=1 default=ignore] pam_unix.so nullok
```

```
/etc/ssh/sshd_config
```

edit the existing line to:

```
PermitEmptyPasswords yes
```

and then

```
passwd -d root #deletes the password for user root
```
