Description

from the webprojects.eecs.qmul.ac.uk help page:

How do I send email from PHP?

You can use the standard PHP mail() function to send email. However

You can only send email to QM email addresses

You can only send email to one recipient at once

There is a one Megabyte size limit on mail sent

The code to send an email (as an example) is:

```
<?php
$to = 'eecsusername@eecs.qmul.ac.uk';
$subject = 'the subject';
$message = 'The body';
$headers = 'Reply-To: eecsusername@eecs.qmul.ac.uk' . "\r\n" . 'X-Mailer: PHP/' . phpversion();
mail($to, $subject, $message, $headers);
?>
```

Now, this might be too QM-specific, but if we put the hooks in there (e.g.: send email notification when someone starts a test or someone ends it, maybe with attached xml (for backup)), then users from other domains can just edit the mail server configuration settings.
