Description

From a bug report received by email. In the Spectrum layer:

-    SV crashes when trying to change window size or overlap. Each individually causes the crash.

-    Loads unpredictably, and can be very slow. The colour and form options (lines, blocks, etc) are unpredictable when trying to change them, and can cause a freeze.

-    The measuring tool does not fit: there appears to be a problem with its scaling. For example, looking at a resonance series (all even and odd multiples of the fundamental), the octave marker is too wide, appearing instead on the 3rd resonance....etc.
