Target version:			
Description			
<p>(Observed on macOS especially)</p> <ul style="list-style-type: none">- Load one or more files- Start playback- Switch to melodic spectrogram- Zoom in or out a bit <p>What typically happens is that the layer is blanked out when the zoom level changes, then it starts re-drawing from the centre for a moment, then as the layer scrolls, it is cleared again and an area at the right edge gets re-painted; this then happens again and again while the rest of the visible area is never repainted.</p>
