Description

Hi,

1) I think there's something wrong with the hg repository access on
https://code.soundsoftware.ac.uk/projects/raeng-stage2/repository
(hg exited with non-zero status: 255)

2) When making new projects I also had the problem that the hg address was not automatically chosen for me during the hg initialisation, but neither could I input it myself. The "solution" was to keep browsing a little, and then refresh the page .. it would then be chosen automatically.

Cheers,
Matthias

I am embarrassed not to have seen this report until today -- bugs like this are high priority. I've increased the level of email notifications I receive and hopefully the service should improve...

I have addressed problem 1 (a Unix groups issue). Let us know if you find any further problems interacting with a repository either through the website or through a Mercurial client.

Problem 2 is actually by design. The web application intentionally doesn't have the capability to create new repositories, so the system periodically checks new projects and creates the repository after the project has been set up. I've tried to make the text on the Repository settings page a bit clearer, so as to indicate that you really should just come back in a few minutes time.
