Description

It would be nice for visualisation/statistics to be able to export alongside a pitch estimate the note it is associate with it in Tony.

Why?

1) Allows you to easily experiment with measures of vibrato etc outside Tony.

2) This could be one thing we explore in the Tony journal paper

How?

Add another column to the csv file.

1,...,N for the note number.

0 for the case in which the pitch point does not occur during a note

What do you think?
